

Name:			
Enrolment No:			
<b>UPES</b> <b>End Semester Examination, December 2024</b>			
<b>Program Name: MSc. Physics</b> <b>Course Name: CLASSICAL MECHANICS</b> <b>Course Code: PHYS 7001</b>		<b>Semester: I</b> <b>Time: 03 hrs.</b> <b>Max. Marks: 100</b>	
<b>Instructions:</b> 1. All questions are compulsory (Q. No. 9 and Q. No. 11 have internal choices). 2. Scientific calculators can be used for calculations. 3. All bold representations are vectors.			
<b>SECTION A</b> <b>(5Qx4M=20Marks)</b>			
S. No.		<b>Marks</b>	<b>CO</b>
Q 1	State Hamilton's principle of stationary action.	<b>4</b>	<b>CO1</b>
Q 2	Define cyclic coordinates and their relation to conservation theorems.	<b>4</b>	<b>CO1</b>
Q 3	Define Poisson brackets for two functions defined on the phase space.	<b>4</b>	<b>CO1</b>
Q 4	Show that Hermitian matrix has orthogonal eigenvectors for distinct eigenvalues.	<b>4</b>	<b>CO2</b>
Q 5	A body of rest mass $m_0$ moving at speed $v$ collides with and sticks to an identical body at rest. What is the mass and momentum of the final clump?	<b>4</b>	<b>CO2</b>
<b>SECTION B</b> <b>(4Qx10M= 40 Marks)</b>			
Q 6	A particle under the action of gravity slides on the inside of a smooth paraboloid of revolution whose axis is vertical. Using the distance from the axis, $r$ , and the azimuthal angle $\varphi$ as generalized coordinates, find (a) The Lagrangian of the system. (b) The generalized momenta and the corresponding Hamiltonian. (c) The equation of motion for the coordinate $r$ as a function of time. (d) If $\frac{d\varphi}{dt} = 0$ , show that the particle can execute small oscillations about the lowest point of the paraboloid, and find the frequency of these oscillations.	<b>10</b>	<b>CO3</b>
Q 7	The transformation equations between two sets of coordinates are $Q = \ln (1 + q^{1/2} \cos p)$ $P = 2 (1 + q^{1/2} \cos p) q^{1/2} \sin p$	<b>10</b>	<b>CO3</b>

	<p>(i) Show directly from these transformation equations that <math>Q, P</math> are canonical variables if <math>q, p</math> are.</p> <p>(ii) Show that the function that generates this transformation between the two sets of canonical variables is</p> $F_3 = -[e^Q - 1]^2 \tan p$		
Q 8	<p>Consider a particle of rest mass <math>m_0</math> moving at velocity <math>v</math> in the frame <math>S</math>. Write down expressions for the components of its energy momentum vector <math>P = (p_0, p_1)</math> in terms of <math>m_0, v</math>. Now if you see this particle from a different frame <math>S'</math> moving at the velocity <math>u</math>. What will be its velocity <math>w</math> and what will be the components of <math>P' = (p'_0, p'_1)</math> first in terms of <math>w</math> and then in terms of <math>w</math> written in terms of <math>u</math> and <math>v</math>? Show that the primed coordinates are related to the unprimed ones by the same Lorentz Transformation that relates <math>(x_0, x_1)</math> to <math>(x'_0, x'_1)</math>.</p>	10	CO2
Q 9	<p>Discuss the method of calculus of variation and obtain the expression that describes the stationary path. Use it to obtain minimum surface of revolution.</p> <p style="text-align: center;"><b>OR</b></p> <p>Derive Hamilton's equations of motion starting from a variational principle.</p>	10	CO2
<p><b>SECTION-C</b> <b>(2Qx20M=40 Marks)</b></p>			
Q 10	<p>Consider two particles interacting by way of a central force (potential = <math>V(r)</math> here <math>\mathbf{r}</math> is the relative position vector).</p> <p>(i) Obtain the Lagrangian in the center of mass system and show that the energy and angular momentum are conserved. Prove that the motion is in a plane and satisfies Kepler's second law (that <math>\mathbf{r}</math> sweeps out equal areas in equal times).</p> <p>(ii) Suppose that the potential is <math>V = kr^2/2</math>, where <math>k</math> is a positive constant, and that the total energy <math>E</math> is known. Find expressions for the minimum and maximum values that <math>r</math> will have during the motion.</p>	15+5 = 20	CO2
Q 11	<p>Consider the longitudinal motion of the system of masses and springs illustrated in the figure below with <math>M &gt; m</math>.</p> <p>(i) What are normal mode frequencies of the system?</p> <p>(ii) If the left-hand mass receives an impulse <math>P_0</math> at <math>t=0</math>, find the motion of the left-hand mass as a function of time.</p> <p>(iii) If, alternatively, the middle mass is driven harmonically at a frequency <math>\omega_0 = 2\sqrt{\frac{k}{m}}</math>, will it move in or out of phase with the driving motion? Explain.</p>	8+8+4=20	CO3
			

OR

Two pendulums of equal length  $l$  and mass  $m$  are coupled by a massless spring of constant  $k$  as shown below. The unstretched length of the spring is equal to the distance between the supports.

- (i) Set up the exact Lagrangian in terms of appropriate generalized coordinates and velocities.
- (ii) Find the normal coordinates and frequencies of small vibrations about equilibrium.
- (iii) Suppose that initially the two masses are at rest. An impulsive force gives a horizontal velocity  $v$  towards the right to the mass  $m$  on the left. What is the motion of the system in terms of the normal coordinates?
