<p style="text-align: center;"><b>UPES</b>  <b>End Semester Examination, May 2025</b></p> <p> <b>Course: Structural Biology and Biophysical Chemistry</b>  <b>Program: INT-BMSC-MICROBIOLOGY</b>  <b>Course Code: HSMB30120</b> </p> <p style="text-align: right;"> <b>Semester: VI<sup>th</sup></b>  <b>Duration: 3 hours</b>  <b>Max. Marks: 100</b> </p> <p><b>Instructions: Carefully read and attempt all the questions.</b></p>			
<b>S. No.</b>	<b>Section A</b> <b>Short answer questions/ MCQ/T&amp;F</b> <b>(20Qx1.5M= 30 Marks)</b>	<b>Marks</b>	<b>COs</b>
<b>Q1.</b>	<b>At the folding transition midpoint (T<sub>m</sub>), what is the Gibbs free energy difference (ΔG) between folded and unfolded states?</b> A. Positive B. Negative C. Zero D. Undefined	<b>1.5</b>	<b>CO1</b>
<b>Q2.</b>	<b>Charged amino acids are most commonly found:</b> A. Inside the hydrophobic core B. On the surface of proteins C. In disulfide bridges D. At the N-terminal only	<b>1.5</b>	<b>CO1</b>
<b>Q3.</b>	<b>Protein folding is thermodynamically favorable because:</b> A. Enthalpy decreases and entropy increases B. Enthalpy increases and entropy decreases C. Enthalpy decreases and entropy of the solvent increases D. Both enthalpy and entropy increase	<b>1.5</b>	<b>CO2</b>
<b>Q4.</b>	<b>Recall the reason for glycine occupying a wider region in a Ramachandran plot compared to other amino acids.</b> A. Its side chain restricts rotation B. It lacks a side chain beyond a hydrogen atom C. It forms extra hydrogen bonds D. It is always charged	<b>1.5</b>	<b>CO1</b>
<b>Q5.</b>	<b>Which of the following is not an advantage of CD spectroscopy?</b> A. Requires small amounts of protein B. Non-destructive and fast C. Suitable for detecting protein folding D. Provides atomic-resolution structure	<b>1.5</b>	<b>CO2</b>
<b>Q6.</b>	<b>NMR spectroscopy primarily detects nuclei that have:</b> A. High molecular mass B. A magnetic moment and non-zero spin C. UV absorbance D. Free electrons	<b>1.5</b>	<b>CO2</b>
<b>Q7.</b>	<b>The phase problem in X-ray crystallography refers to the:</b> A. Difficulty in obtaining high-resolution crystals B. Loss of amplitude during detection	<b>1.5</b>	<b>CO2</b>

	C. Inability to directly measure phase information from diffraction data D. Decay of crystals under X-rays		
<b>Q8.</b>	<b>Describe the primary reason for using cryo-cooling (e.g., liquid nitrogen) during X-ray data collection.</b> A. Increase signal intensity B. Prevent water evaporation C. Reduce radiation damage to the crystal D. Enhance diffraction resolution	<b>1.5</b>	<b>CO2</b>
<b>Q9.</b>	<b>In an XFEL experiment, why are extremely short X-ray pulses important?</b> A. They improve sample cooling B. They outrun radiation damage before it destroys the sample C. They decrease signal intensity D. They increase crystal size	<b>1.5</b>	<b>CO1</b>
<b>Q10.</b>	<b>XFEL sources are particularly powerful for studying:</b> A. Very large crystals only B. Single molecules and nanocrystals C. Only metal complexes D. Only surface topographies	<b>1.5</b>	<b>CO1</b>
<b>Q11.</b>	<b>Identify the detector revolutionized Cryo-EM by increasing resolution and sensitivity.</b> A. Photographic film B. CCD camera C. Direct Electron Detector (DED) D. CMOS sensor	<b>1.5</b>	<b>CO1</b>
<b>Q12.</b>	<b>Efficient FRET requires that:</b> A. Donor emission spectrum overlaps acceptor absorption spectrum B. Donor absorption spectrum overlaps acceptor absorption spectrum C. Acceptor emits at a longer wavelength than the donor absorbs D. Donor and acceptor are separated by > 100 nm	<b>1.5</b>	<b>CO1</b>
<b>Q13.</b>	<b>Fluorescence emission typically occurs at a longer wavelength than absorption because of:</b> A. Excited state instability B. Vibrational relaxation before photon emission C. Higher energy of emitted photons D. Stronger absorption	<b>1.5</b>	<b>CO2</b>
<b>Q14.</b>	<b>In a Jablonski diagram, fluorescence occurs when an excited electron returns from:</b> A. Ground state to excited state B. Excited singlet state to ground singlet state C. Triplet state to ground state D. Excited state to a vibrational state	<b>1.5</b>	<b>CO1</b>
<b>Q15.</b>	<b>During an EPR experiment, if no signal is detected, a logical explanation could be:</b> A. The sample contains no unpaired electrons B. The magnetic field is too high	<b>1.5</b>	<b>CO2</b>

	C. The sample temperature is too low D. The microwave frequency is too high		
<b>Q16.</b>	<b>In an MD simulation, you see that water molecules near the protein surface are highly ordered. What does this most likely indicate?</b> A. Water evaporation B. Formation of clathrate structures C. Formation of a hydration shell D. Instability in the simulation	<b>1.5</b>	<b>CO2</b>
<b>Q17.</b>	<b>In MD simulations, periodic boundary conditions are mainly used to:</b> A. Limit simulation time B. Increase the size of the system C. Mimic an infinite system and avoid edge effects D. Increase the number of atoms artificially	<b>1.5</b>	<b>CO1</b>
<b>Q18.</b>	<b>Identify the regions in the RNA secondary structure NOT preferred for RNA-protein interactions.</b> A. Helices B. Internal loops C. Bulge loops D. Multibranch loops	<b>1.5</b>	<b>CO1</b>
<b>Q19.</b>	<b>Recall the correct statement about the G-U wobble base pair in RNA.</b> A. It destabilizes the secondary structure completely B. It is forbidden in stems and loops C. It is less stable than Watson-Crick pairs but tolerated in RNA D. It forms only in DNA	<b>1.5</b>	<b>CO1</b>
<b>Q20.</b>	<b>Identify the TRUE statements about RNA pseudoknots.</b> A. They are formed by simple hairpin loops B. They involve base pairing between two completely adjacent regions C. They result from base-pairing between a loop and a complementary sequence outside the loop D. They are unstable and never found in functional RNAs	<b>1.5</b>	<b>CO2</b>
<b>Section B</b> <b>(4Qx5M=20 Marks)</b>			
<b>Q1.</b>	List additional common base-pairing interactions found in RNA and examine the methods and significance of RNA secondary structure prediction.	<b>5</b>	<b>CO3</b>
<b>Q2.</b>	Differentiate between the processes of minimization and equilibration during molecular dynamics simulations.	<b>5</b>	<b>CO2</b>
<b>Q3.</b>	Define the Stokes shift and identify the amino acids typically analyzed using fluorescence spectroscopy in a protein.	<b>5</b>	<b>CO2</b>
<b>Q4.</b>	State Bragg's Law and derive Bragg's equation, supporting your derivation with an appropriate diagram.	<b>5</b>	<b>CO3</b>

<b>Section C</b> <b>(2Qx15M=30 Marks)</b>			
<b>Q1.</b>	Design an experiment to investigate protein-protein interactions within a cellular environment. Evaluate the chosen technique and analyze its limitations.	<b>5 + 10</b>	<b>CO4</b>
<b>Q2.</b>	Plan an experimental approach to examine the influence of different buffers on protein stability and explain the underlying principle with the aid of an illustrative diagram.	<b>7 + 8</b>	<b>CO4</b>
<b>Section D</b> <b>(2Qx10M=20 Marks)</b>			
<b>Q1.</b>	Differentiate between synchrotron radiation and XFEL and describe the concept of bunching as it applies to XFEL.	<b>5 + 5</b>	<b>CO3</b>
<b>Q2.</b>	Explain the concept of Larmor frequency. Describe the working principle of NMR spectroscopy and evaluate its advantages over X-ray crystallography for structural studies.	<b>3 + 7</b>	<b>CO3</b>
