Name: Enrolment No:	UPES

UNIVERSITY OF PETROLEUM AND ENERGY STUDIES
End Semester Examination, December 2018

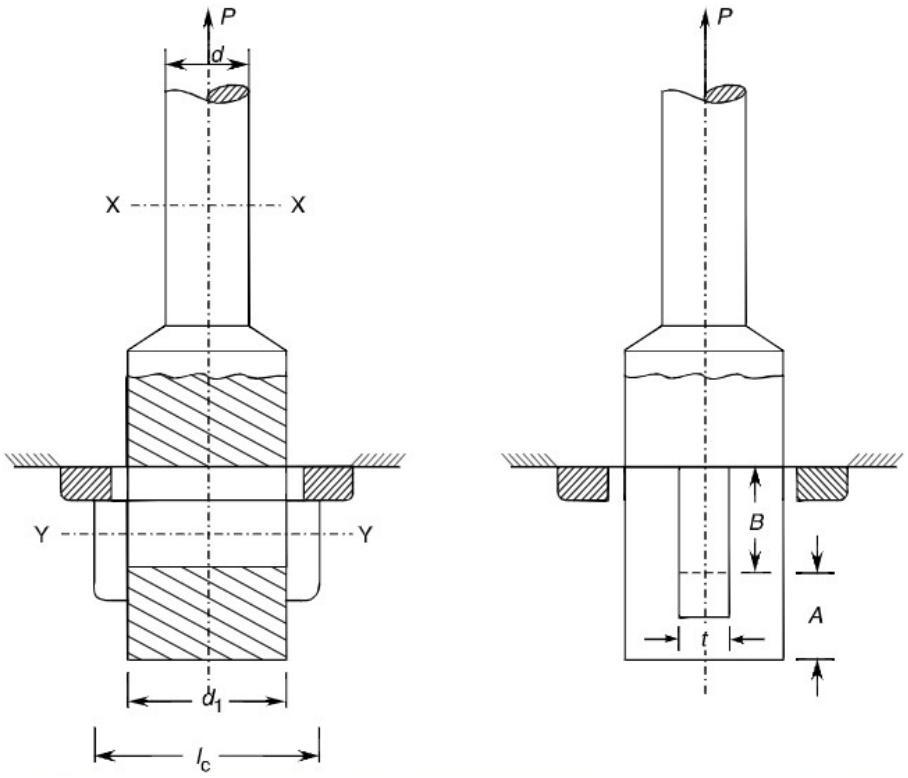
Course: Design of Machine Elements **Semester: V**
Programme: B.Tech ADE
Time: 03 hrs. **Max. Marks: 100**
Instructions: Use of Design data handbook is allowed.

SECTION A

S. No.		Marks	CO
Q 1	Briefly summarize the following terminologies: i. Endurance limit. ii. Fatigue life. iii. Pitch circle of gear iv. Diametral Pitch v. Module	10	CO2,CO4
Q2	Identify the various steps involved for the approximate estimation of endurance limit.	10	CO2

SECTION B

Q 3	A bracket is attached to the vertical column by means of six identical bolts as shown in fig. It is subjected to an eccentric force of 60 kN at a distance of 200 mm from the centre of the column. The maximum permissible shear for the bolt is 150 N/mm^2. Determine the size of the bolts.  **OR** Design a cottered foundation rod, as shown in figure, to carry an axial tensile pull of 15 kN. The bolt and the cotter are made of the same material having the following permissible stresses: σ_t = 40 N/mm^2, τ = 25.0 N/mm^2, and σ_c = 75 N/mm^2. Neglect the effect of stress concentration.	15	CO3

Q 4	Design a rigid type of flange coupling to connect two shafts of 36 mm diameter transmitting 15 kW at 720 rpm. The overload capacity is 1.25 times of the rated torque. Select the suitable material for the required components.	**15**	**CO4**
Q 5	A polished steel bar 30C8 (S_{ut}=1250 N/mm^2) is subjected to axial tensile force P. It has a groove 2 mm deep and having a radius of 3 mm. The notch sensitivity factor at the groove is .95. The outer diameter of the bar is 30 mm. The endurance limit in completely reversed bending is 600 MPa. Find the maximum force that the bar can carry for 10^5 cycles with 90% reliability. 	**10**	**CO2**
	SECTION-C		
Q 6	A line shaft received power through a gear and pinion. The pinion is connected to an electric motor delivering 30 kW at 1200 rpm, of which 20 kW is supplied to a milling	**20**	**CO4**

	machine through a horizontal pulley drive at P1 and the remainder of the power is supplied to a planer through pulley P2 by a vertical belt. The diameters of gear and pinion are 300 mm and 100 mm, respectively. The diameter of pulleys P1 and P2 are 750 mm and 900 mm respectively. The the layout of the shaft is shown in fig below and the ratio of belt tensions in both drives is 2.0, design the shaft on the basis of strength. (20)  **OR** A shaft is supported on bearing A & B at both the end and 800 mm apart from each other. A 20^0 straight tooth spur gear having 600 mm pitch diameter is located at 200 mm to the right of the left hand bearing A, and a 700 mm diameter pulley is mounted at 250 mm towards the left of bearing B. The gear is driven by a pinion with a downward tangential force while the pulley drives a horizontal belt having 180^0 angle of wrap. The pulley also serves as a flywheel and weighs 3000 N. the maximum belt tension is 3000N and the tension ratio is 3. The shaft received 20 kW at 500 rpm and the load factor is 2.5. Design the shaft on ASME code basis also select the single row deep groove ball bearing if the expected life for 90% of the bearings is 8000h.		
Q 7	Design a spur gear to transmit the power of 10kW. The speed of driving motor and driven machines are 400 and 200 RPM. (20)	**20**	**CO4**

Values of coefficients a and b in surface finish factor

Surface finish	*a*	*b*
Ground	1.58	–0.085
Machined or cold-drawn	4.51	–0.265
Hot-rolled	57.7	–0.718
As forged	272	–0.995

Values of size factor

Diameter (d) (mm)	K_b
$d \le 7.5$	1.00
$7.5 < d \le 50$	0.85
$d > 50$	0.75

Reliability factor

Reliability R (%)	K_c
50	1.000
90	0.897
95	0.868
99	0.814
99.9	0.753
99.99	0.702
99.999	0.659
