Name:	UPES
Enrolment No:	UNIVERSITY WITH A PURPOSE

UNIVERSITY OF PETROLEUM AND ENERGY STUDIES

Online End Semester Examination, December 2020

Course: Coal Bed Methane Technology
Program: B. Tech. APE UP
Semester: VII
Time 03 hrs.

Course Code: PTEG 426/PEAU4009P Max. Marks: 100

SECTION A

- 1. Each Question will carry 5 Marks
- 2. Each Sub-Question consisting of MCQ, FIB, MA and TF will carry 1 Mark.

	Each Sub-Question consisting of MCQ, FIB, MA and TF will carry 1 Mark. Instruction: Complete the statement / Select the correct answer(s)	
S. No.	Question	CO
Q 1	i) Organic matter is a key component in the ability to store methane in coalbed methane resources (CBM) a) True b) False ii) Which one does not define the coal characteristic a) Organic and inorganic composition b) Temperature & Pressure c) Burial History d) Geological age of coal iii) Which of the following statements is/are correct about the litho type Clarain? a) It is brighter than vitrain b) It is friable c) Contains small amounts of vitrinite but more inertinite and liptinite d) Both a and c iv) As volatile matter content of coal decreases, Methane generation a) Increases b) Remains constant c) Decreases v) The maximum V Ro% for hvAb rank of coal ranges from a) 0.47 to 0.57 b) 0.57 to 0.71 c) 0.71 to 1.1 d) 1.1 to 1.5	CO1
Q2	i) Determination of the anisotropy ratio must be evaluated as a decision point between vertical development and the use of horizontal wellbores to access CBM gas. a. Porosity b. Cleat c. Fracture d. Permeability ii) Established CBM Reserves (in TCF) in India is about a) 12.5 b) 9.9 c) 8.5 d) 12.7	CO4

 iii) Water associated with a CBM a) Adherent moisture b) Inherent moisture c) Chemically bound water d) All of these iv) CBM wells go through the different production stages: The stable stage of the CBM well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	
 b) Inherent moisture c) Chemically bound water d) All of these iv) CBM wells go through the different production stages: The stable stage of the CBM well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	I
 c) Chemically bound water d) All of these iv) CBM wells go through the different production stages: The stable stage of the CBM well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	
d) All of these iv) CBM wells go through the different production stages: The stable stage of the CBM well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low	
 iv) CBM wells go through the different production stages: The stable stage of the CBM well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	
well is characterized by a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low	
 a) A large volumes of groundwater are pumped from the seam to reduce the underground pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	
pressure and encourage the natural gas to release from the coal seam b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low	
 b) Amount of natural gas produced from the well increases as the amount of groundwater pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low 	
pumped from the coal seam decreases c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low	
c) Amount of gas produced declines and the amount of groundwater pumped from the coal seam remains low	
coal seam remains low	
d) None	
v) Which of the following coalfields is categorized as Category-I in India for CBM	
presence.	
a) Raniganj	
b) Jharia	
c) Talchir	
d) Assam-Arakan	
Q3 i) The gas contents of the Coal seam is expressed as	
a) $cm3/t$	03
b) m3/t	
c) m3/MT	
d) None	
ii) Which one of these mechanisms is not responsible for creation of the cleating system	ļ
of coals:	
a) Devolatilization during coalification.	
b) Dehydration during coalification.	
c) Concentration of organic matter	
d) Compaction	
iii) Which of the following is true about the mechanism for gas flow in the coal.	
a) Desorption of gas from the coal surface inside the micropores	
b) Diffusion of gas through the micropores	
c) Darcy flow through the fractures	
d) All of these	
iv) The capacity of methane sorption is expressed as	
a) cm3/g	
b) MPa	
c) m3/g	
d) cm3/kg The basic Equation used to calculate the gas in place is:	
v) The basic Equation used to calculate the gas in place is: a) GIP = (h * A) * Dc * Gc	
a) GIP = (n * A) * Dc * Gc b) GIP = (h + A) * Dc * Gc	
b) GIP = (II + A) * Dc * Gc c) GIP = (h * A) + Dc * Gc	
d) $GIP = (II + A) + DC + GC$	
u) Gli = (li A) De +Ge	
Q4 i) Dry FC 78% or more and less than 86% is found in	
a) Medium volatile bituminous coal	0.2
b) High volatile bituminous coal	J 2
c) Low volatile bituminous coal	
d) Semi-Anthracite	

	ii)	Which of the following is not a factor affecting sorption isotherm?	
	a)	Temperature	
	b)	Reservoir Depth	
	c)	Moisture	
	d)	Gas Composition	
	iii)	Frequency of the cleats is proportional to the thickness of the vitrain layers.	
	a)	Directly	
	_	Linearly	
	c)	Indirectly	
	-	Inversely	
	iv)	The Langmuir equation, used to construct the isotherm of methane sorption on coal	
	'''	as pressure is varied while keeping temperature constant, a path similar to CBM	
		production is expressed as	
	2)	V = V max BP/ 1 -BP	
	-		
		V = V max BP/1 + BP	
		V = V min BP/1 + BP	
	,	V = V max BP/ 1 x BP	
	v)	What is the behaviour of Gas Recovered v/s Original Pressure curve in Coal reservoir	
		and Conventional Gas reservoir?	
	1	Linear in Coal reservoir and Non-linear in Conventional Gas reservoir	
	,	Non-linear in both reservoirs	
	c)	Non-linear in Coal reservoir and Linear in Conventional Gas reservoir	
	d)	Linear in both reservoirs	
Q5	i)	Permeability of Coal reservoir is complex due to the high degree of	
		Homogeneity	
		Rank of Coal	CO ₂
	(c)	Spatial variation in maceral composition None of these	
	ii)	Which of the following statements regarding the physical adsorption of a gas on	
	11)	surface of solid is not correct?	
	a)	On increasing temperature, adsorption increases continuously	
	b)	Enthalpy changes are negative	
		Adsorption is specific	
	/	It is reversible in nature	
	iii)	At normal coal bed pressures, absorbed gas occupies roughly of the	
		total gas content in coal,	
		80 to 90% 70 to 80%	
	/	90 to 95%	
	/	60 to 70%	
	iv)	Critical Desorption pressure is the pressure at which	
		1/4 Langmuir volume is adsorbed	
		1/2 Langmuir volume is adsorbed	
	c)	1/8 Langmuir volume is adsorbed	
		Complete Langmuir volume is adsorbed	
	v)	During absorption of methane in coal there is a continual interchange of molecules	
		between the free gas and the adsorbed gas	
		True False	
	0)	1 4150	

Q6	i) Which of those test holps meet to determine the between situal the CDM meeting	ir
ζO	i) Which of these test helps most to determine the heterogeneity of the CBM reservo	CO3
	along with the degree of connectivity	COS
	a) Pressure Buildup (PBU) Test	
	b) Below Fracture Pressure-Injection Falloff Test	
	c) Multi-Well Interference Test (Fractured media)	
	d) Drillstem Test(DST)	
	ii) Choose the correct sequence of increasing ROP during CBM drilling for the following	B
	drilling fluids.	
	a) Air > Foam > Mist > Aerated Liquid	
	b) Air > Mist > Foam > Aerated Liquid	
	c) Foam > Air > Mist > Aerated Liquid	
	d) Foam > Mist > Air > Aerated Liquid	
	iii) The foam cement places more pressure on the unique cleat structures of coal beds,	
	reducing the tendency of the cement to exceed the fracture gradient of the coal.	
	a) True	
	b) False	
	iv) In some areas, dynamic-cavity completions results in gas rates that are substantially	/
	greater than fracture-stimulated wells.	
	a) True	
	b) False	
	v) Hydrofracking is generally highly effective for shallow depths horizontal section in	
	Coal seams For commercial gas production	
	a) False	
	b) True	
	SECTION B	
1. 2.	Each question will carry 10 marks Instruction: Write short / brief notes	
	Instruction. Write short / brief notes	
7	Write very short notes on any Four from following:	CO1
	a) Physical and chemical characteristics of plant debris and coal with maturation	
	b) Why CBM is different from conventional Methane reservoir	
	c) Differentiate between biogenic and thermogenic methane	
	d) CH4 Retention by Coal seams	
	e) How Coalbed methane is Stored in Coal	
8	Describe Langmuir Isotherm. What are the applicability of Langmuir Isotherm	CO2
	OR	
	Describe in detail the volumetric method of Coal bed Methane Reserve Estimation. How	/
	the recovery factor is determined	
9	Write short notes on any TWO from followings:	CO2
	a) Sorption capacity with geologic parameters.	
	b) Estimation of SCF per ton of CBM	
	c) Proximate Analysis of Coal	

a) Describe drilling technology of a CBM well.b) What are the advantage and disadvantages of various completion techniques

CO3

Q 10

	OR What is the relationship of Coal porosity and its permeability. Describe the permeability	
İ	behavior in coal seams during CBM production	
Q 11	a) Schematic of a Vertical Cased Hole Multi-Seam Completionb) What are the factors to be considered for hydro-fracturing in coal	CO3
	Section C	
1. E	Each Question carries 20 Marks.	
2. I	nstruction: Write long answer.	
Q 12	Considering the Technical and Commercial risks, assess the economic viability of a CBM	CO4
	project	
	OR	
	a) Describe the status of exploration and exploitation of CBM in India.	
	b) Describe the current scenario of CBM production and future of CBM in India.
