| Course: $\quad$ Flight Mechanics II Program: $\quad$ B.Tech ASE/ASE+AVE Course Code: ASEG4001 | UNIVERSITY OF PETROLEUM AND ENERGY STUDIES   <br> End Semester Examination, December 2020   <br>  Flight Mechanics II Sen <br> B.Tech ASE/ASE+AVE Tim  <br> Code: ASEG4001 Ma  <br>    <br> ions: Assume the necessary data if not given. Use suitable plots wherever required.   | Semester: VIIth Time 03 hrs. <br> Max. Marks: 100 | $\begin{aligned} & \text { IIth } \\ & 100 \end{aligned}$ |
| SECTION A (6*5 = 30) |  |  |  |
| S. No. |  | $\begin{gathered} \text { Mark } \\ \hline \mathbf{s} \\ \hline \end{gathered}$ | CO |
| Q 1 | Define the following terms. <br> (a) Neutral point <br> (b) Static margin. | 5 | CO1 |
| Q 2 | Graphically represent a system, which is statistically stable but dynamically unstable. | 5 | $\mathrm{CO1}$ |
| Q 3 | What do you understand by tail efficiency? How does it change with the location of tail surface? | 5 | CO2 |
| Q 4 | Define Stick-fixed maneuver point ( $\mathbf{x}_{\text {mp }}$ ). | 5 | CO3 |
| Q 5 | Differentiate between yaw and sideslip angle. | 5 | CO4 |
| Q 6 | What is the purpose of a dorsal fin and how is it achieved? | 5 | CO4 |
| SECTION B ( $5 * 10=50$ ) |  |  |  |
| Q 7 | An airplane has the following characteristics. <br> $\mathrm{C}_{\text {Law }}=0.080 \mathrm{deg}^{-1}, \mathrm{C}_{\mathrm{L} \alpha \mathrm{t}}=0.05 \mathrm{deg}^{-1}, \mathrm{dC}_{\mathrm{L}} / \mathrm{d} \delta \mathrm{e}=0.042, \mathrm{C}_{\text {hat }}=-0.004 \mathrm{deg}^{-1}, \mathrm{C}_{\mathrm{h} \delta \mathrm{t}}=-$ $0.005, \mathrm{i}_{\mathrm{w}}=0, \alpha_{0 \mathrm{~L}}=-2^{0}, \mathrm{i}_{\mathrm{t}}=-1^{0}, \varepsilon=0.5 \alpha, \mathrm{~S}_{\mathrm{t}}=0.25 \mathrm{~S}, \mathrm{l}_{\mathrm{t}}=3 \mathrm{c}, \mathrm{W} / \mathrm{S}=1500 \mathrm{~N} / \mathrm{m}^{2}$, a.c. location $=0.25 \mathrm{c}, \eta=1.0,\left(\mathrm{C}_{\mathrm{m} \alpha}\right)_{\mathrm{f}, \mathrm{n}, \mathrm{p}}=0.32 \mathrm{rad}^{-1}$. <br> Obtain <br> i) Stick-fixed neutral point <br> ii) Stick-free neutral point | 10 | CO2 |
| Q 8 | Derive an expression for stick force gradient (dF/dV) and explain the requirement for proper stick force variation | 10 | CO2 |
| Q 9 | Answer the following. <br> (a) Define the term maneuver point stick-fixed and maneuver point stick-free. <br> (b) For a given value of $\mathrm{C}_{\mathrm{L}}$ the elevator deflection required in pull-up is more than that in a steady level flight. Explain. | 10 | $\mathrm{CO3}$ |
| Q 10 | An airplane with the following characteristics is coming in to land at sea level at a speed of 1.2 times the stalling speed. What would be the amount of rudder deflection required ( $\delta \mathrm{r}$ ) if the airplane encounters crosswind of $10 \mathrm{~m} / \mathrm{s}$ ? | 10 | CO4 |

|  | Additional parameters are given as, $\mathrm{W} / \mathrm{S}=1500 \mathrm{~N} / \mathrm{m}^{2}, \mathrm{~V}_{\mathrm{v}}=0.05, \mathrm{C}_{\mathrm{L} \alpha \mathrm{v}}=2.87 \mathrm{rad}^{-1}$, $\mathrm{C}_{\mathrm{n} \beta}=0.071 \mathrm{rad}^{-1}, \mathrm{C}_{\mathrm{Lmax}}=1.8, \eta_{\mathrm{v}}=1.0, \tau_{\text {rudder }}=0.5$. <br> Or <br> Explain how adverse yaw is brought about in an airplane. The wind tunnel tests on an airplane model indicate that full aileron deflection to right introduces an adverse yaw causing $\mathrm{Cn}=-0.008$. How many degrees of rudder must be applied to keep the sideslip zero during the roll? Given that $S=16.4 \mathrm{~m}^{2}, S_{v}=2.1 \mathrm{~m}^{2}, 1_{v}=5.5 \mathrm{~m}, \mathrm{~b}=9.8$ $\mathrm{m}, \eta_{\mathrm{v}}=0.95, \mathrm{C}_{\mathrm{L} \alpha \mathrm{v}}=0.045 \mathrm{deg}^{-1}, \tau_{\text {rudder }}=0.5$. |  |  |
| :---: | :---: | :---: | :---: |
| Q11 | Define the following axes system. <br> (a) Ground axes system <br> (b) Body axes system <br> (c) Stability axes system. | 10 | CO5 |
|  | SECTION-C ( $\mathbf{1 * 2 0 = 2 0 )}$ |  |  |
| Q 12 | a) The longitudinal stability quartic of an airplane is $\lambda^{4}+4 \lambda^{3}+10 \lambda^{2}+\lambda+3.8=0$. <br> Extract the roots and describe the motion depicted by them. (10M) <br> OR <br> The roots of a longitudinal stability quartic are:- $2.57 \pm$ i $2.63 ;+0.02$ and- 0.26. Discuss the types of motions indicated by each mode. What would be the final motion of the airplane? <br> b) The lateral stability quartic for an airplane is: $\lambda^{4}+16 \lambda^{3}+13.1 \lambda^{2}+9.8 \lambda+0.73=0$ extract the roots of this quartic. Obtain the time to double or halve the amplitude and the period of the oscillatory mode(s). (10M) <br> OR <br> Derive the relationship between general body axes system and local horizon system for $\mathbf{i}_{\mathbf{h}}$. | 20 | CO5 |
