## UNIVERSITY OF PETROLEUM AND ENERGY STUDIES <br> End Semester Examination, December 2022

Course: Process Calculation
Program: B. Tech. Biotechnology
Course Code: HSBT 2003

Semester: III
Time : 03 hrs .
Max. Marks: 100

Instructions: Instructions: Assume any missing data. The notations used here have the usual meanings. Draw the diagrams, wherever necessary.

| Q. 1 | Section-A (20Q x 1.5M=30) |  | COs |
| :---: | :---: | :---: | :---: |
| I | $1 \mathrm{BTU} / \mathrm{ft}^{3}$ is approximately equal to $\qquad$ $\mathrm{kcal} / \mathrm{m}^{3}$. <br> (a) 1 <br> (b) 9 <br> (c) 4 <br> (d) 252 | 1.5 | CO1 |
| II | Volume (L) representation of a real gas is given by the equation $\mathrm{V}=\mathrm{a} T+\mathrm{bTP}+\mathrm{c} T \mathrm{Pn}$ <br> where: $\mathrm{a}, \mathrm{b}, \mathrm{c}$ are constants and $\mathrm{T}, \mathrm{P}, \mathrm{n}$ are temperature $(\mathrm{K})$, pressure ( atm ) and number of moles, respectively. <br> What is the unit of c ? <br> (a) L/K-atm <br> (b) L/K-atm-mol <br> (c) K/L-atm-mol <br> (d) None of these | 1.5 | CO1 |
| III | Number of moles of the solute dissolved in 1 kg of solvent is called its <br> (a) normality <br> (b) molarity <br> (c) molality <br> (d) equivalent weight | 1.5 | CO1 |
| IV | Hydrogen and nitrogen react to form ammonia according to the reaction, $3 \mathrm{H}_{2}+\mathrm{N}_{2} \rightarrow 2 \mathrm{NH}_{3}$ <br> If 4.0 moles of $\mathrm{H}_{2}$ and 2.0 moles of $\mathrm{N}_{2}$ are fed, which is a limiting reactant? <br> (a) Hydrogen <br> (b) Nitrogen <br> (c) Ammonia <br> (d) None of the given | 1.5 | CO 2 |
| V | Concept of material balance is based upon $\qquad$ <br> (a) Conservation of mass <br> (b) Conservation of energy <br> (c) Conservation of momentum <br> (d) Conservation of Volume | 1.5 | CO 2 |
| VI | A fluid enters system at the rate of 10 liters/s and leaves in two pathways one with 7 liters/s and other with 3 liters/s. The type of flow it is $\qquad$ <br> (a) Steady state <br> (b) Unsteady state <br> (c) batch <br> (d) None of these | 1.5 | CO 2 |
| VII | In the given tank, there are two feeds and one output. Consider a 2 hour operation; the feed rates are $4000 \mathrm{~kg} / \mathrm{hr}$ and $6000 \mathrm{~kg} / \mathrm{hr}$. The accumulated material inside the tank is 2000 kg . What is the output rate $\mathrm{kg} / \mathrm{hr}$ of the material? | 1.5 | CO 2 |

|  | (a) 9000 <br> (b) 7000 <br> (c) 8000 <br> (d) 6000 |  |  |
| :---: | :---: | :---: | :---: |
| VIII | 15 kg of oxygen and 15 kg of hydrogen are mixed together. Which one will have greater partial pressure in the resulting mixture? <br> (a) Hydrogen <br> (b) Oxygen <br> (c) Both have same partial pressure <br> (d) Partial pressure depends on their vapor pressure | 1.5 | CO2 |
| IX | In the following, steam reforming reaction of methane $2 \mathrm{CH}_{4}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{CO}+\mathrm{CO}_{2}+7 \mathrm{H}_{2}$ <br> The limiting reactant is $\qquad$ <br> (a) $\mathrm{CH}_{4}$ <br> (b) $\mathrm{H}_{2} \mathrm{O}$ <br> (c) CO <br> (d) $\mathrm{CO}_{2}$ | 1.5 | CO 2 |
| X | For the given reaction $\mathrm{C}_{5} \mathrm{H}_{12}+8 \mathrm{O}_{2} \rightarrow 5 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}$ <br> If 2 moles of $\mathrm{C}_{5} \mathrm{H}_{12}$ and 8 moles of $\mathrm{O}_{2}$ are present initially, which is the excess reactant in the reaction <br> (a) $\mathrm{O}_{2}$ <br> (b) $\mathrm{C}_{5} \mathrm{H}_{12}$ <br> (c) $\mathrm{CO}_{2}$ <br> (d) $\mathrm{H}_{2} \mathrm{O}$ | 1.5 | CO 2 |
| XI | In the van der Waals equation of state, the term that accounts for the intermolecular forces is <br> (a) $\mathrm{V}-\mathrm{b}$ <br> (b) $a / V^{2}$ <br> (c) RT <br> (d) $(\mathrm{RT})^{-1}$ | 1.5 | CO1 |
| XII | Two effluent streams are mixed. One stream contains $10 \%$ salt and the other contains $0 \%$ salt. The combined stream contains $2 \%$ salt. The ratio of the two streams is $\qquad$ <br> (a) $1: 4$ <br> (b) $1: 5$ <br> (c) $1: 2$ <br> (d) $1: 8$ | 1.5 | CO2 |
| XIII | The compressibility factor for an ideal gas is $\qquad$ <br> (a) 1 <br> (b) 0 <br> (c) 100 <br> (d) None of these | 1.5 | CO2 |
| XIV | The volume of an ideal gas, when you double the pressure at a fixed temperature, becomes <br> (a) double <br> (b) half <br> (c) doesn't change <br> (d) None of these | 1.5 | CO2 |
| XV | A cooking gas cylinder can withstand a pressure of 15 atm . The pressure inside the cylinder is 12 atm at $27{ }^{\circ} \mathrm{C}$. During sudden fire in the building the temperature starts rising. At what temperature will the cylinder explode? <br> (a) 306.75 K <br> (b) 240 K <br> (c) 375 K <br> (d) 510 K | 1.5 | CO 2 |
| XVI | Zero percent relative saturation means <br> (a) $100 \%$ vapor in the air <br> (b) $75 \%$ vapor in the air <br> (c) $30 \%$ vapor in the air <br> (d) No vapor in the air | 1.5 | CO1 |

| XVII | The usual temperature of a gas or liquid is <br> (a) Dry bulb temperature <br> (b) Wet bulb temperature <br> (c) Normal temperature <br> (d) special temperature | 1.5 | CO 1 |
| :---: | :---: | :---: | :---: |
| XVIII | The absolute humidity of air at 101.3 kPa is measured to be 0.02 kg of water per kg of dry air. The partial pressure of water vapor in the air is $\qquad$ <br> (a) 3.16 kPa <br> (b) 1.26 kPa <br> (c) 5.96 kPa <br> (d) 6.32 kPa | 1.5 | CO 2 |
| XIX | Heat capacity of a gas can be approximately expressed as $\mathrm{C}_{\mathrm{p}}=26.693+7.365 \times 10^{-3} \mathrm{~T}$, where $\mathrm{C}_{\mathrm{p}}$ is in $\mathrm{J} / \mathrm{mol}-\mathrm{K}$ and T is in K . The heat given off by one mol of air, when cooled at 1 atmospheric pressure from 773 K to 173 K is $\qquad$ <br> (a) 8.11 kJ <br> (b) 18.11 kJ <br> (c) 12.11 kJ <br> (d) 50 kJ | 1.5 | CO 2 |
| XX | At higher temperature, molal heat capacities of most of the gases at constant pressure with increase in temperature. <br> (a) increases <br> (b) decreases <br> (c) doesn't change <br> (d) None of these | 1.5 | CO 1 |
| Section-B (4Q x 5M = 20 M ) |  |  |  |
| 2. | Define the following terms (any two): <br> (a) Limiting reactant <br> (b) Percent conversion <br> (c) Selectivity | 5 | CO1 |
| 3. | What are the characteristics of an ideal gas? | 5 | CO 3 |
| 4. | Fresh juice contains $14 \%$ solids and $86 \%$ water by weight and is to be concentrated to contain $42 \%$ solids by weight. In a single evaporator system, it is found that the volatile constituents of juice escape with water leaving the concentrated juice $56 \%$, with a flat taste. To overcome this problem part of the fresh juice, bypass the evaporator. Calculate the fraction of juice that bypass the evaporator. | 5 | CO 4 |
| 5. | The vapor pressure $P^{s}$ of n-heptane is given by the Antonie equation $\ln P^{s}=13.8587-\frac{2911.32}{T-56.56}$ <br> where $P^{s}$ is in kPa and T is in K . Calculate <br> (a) The vapor pressure of n-heptane at 325 K | 5 | CO 3 |

|  | (b) The normal boiling point of n-heptane |  |  |
| :---: | :---: | :---: | :---: |
| Section-C (2Q x 15M = 30 M ) |  |  |  |
| 6. | The dry bulb temperature and dew point of ambient air were found to be 302 K and 291 K respectively. The barometer reads 100.0 kPa absolute. The vapor pressure of water at dew point is 2.0624 kPa . Compute <br> (a) the molar humidity <br> (b) the absolute humidity <br> (c) the percent relative humidity <br> (d) the percent saturation <br> (e) the humid heat | 15 | CO3 |
| 7. | Pure naphthalene is fed to a jacketed heater at $32^{\circ} \mathrm{C}$ and is vaporized at atmospheric pressure by condensing Dowtherm-A vapors in a jacket at $1.15 \mathrm{~kg} / \mathrm{m}^{2}\left(\mathrm{~T}_{\mathrm{sat}}=260^{\circ} \mathrm{C}\right.$ and latent heat of vaporization is $68.6 \mathrm{kcal} / \mathrm{kg}$ ). Assume no subcooling of vapors. Calculate the quantity of Dowtherm-A condensed per 10 kg of naphthalene evaporated. <br> Boiling point: $218^{\circ} \mathrm{C}$ <br> Melting point: $80^{\circ} \mathrm{C}$ <br> Latent Heat of Vaporization: $75.5 \mathrm{kcal} / \mathrm{kg}$ <br> Latent Heat of Fusion: $36 \mathrm{kcal} / \mathrm{kg}$ <br> Use the average $\mathrm{C}_{\mathrm{p}}$ of solid is given by : $\mathrm{C}_{\mathrm{s}}=0.28+0.0011 \mathrm{~T} \mathrm{kcal} / \mathrm{kg}{ }^{\circ} \mathrm{C}$ <br> Use the average $\mathrm{C}_{\mathrm{p}}$ of liquid is given by: $\mathrm{C}_{1}=0.35+0.0008 \mathrm{~T} \mathrm{kcal} / \mathrm{kg}{ }^{\circ} \mathrm{C}$ where T is in ${ }^{\circ} \mathrm{C}$. | 15 | CO4 |
| Section-D (2Q x 10M = 20 M ) |  |  |  |
| 8. | Estimate the molar volume of $\mathrm{CO}_{2}$ at 500 K and 100 bar using the <br> (a) ideal gas equation <br> (b) van der Waals equation <br> The van der Waals constants are $\mathrm{a}=0.364 \mathrm{~N} \mathrm{~m}^{4} / \mathrm{mol}^{2} \text { and } \mathrm{b}=4.267 \times 10^{-5} \mathrm{~m}^{3} / \mathrm{mol}$ | 10 | CO 3 |
| 9. | Final Purification stage in the preparation of vitamins from natural sources requires centrifuging and continuous filtration as depicted in figure. Determine the flow rate of recycle stream. | 10 | CO4 |
