| Cours <br> Progr <br> Cours <br> Instru <br> before | UPES <br> End Semester Examination, December 2023 <br> Vehicle Dynamics <br> B.Tech ADE <br> Code: MEAD3001 <br> ions: Wherever applicable, must draw appropriate free body diagram and bbstituting numerical values. |  | $\begin{gathered} : V \\ \mathrm{hrs} \\ \mathbf{1 0 0} \end{gathered}$ <br> ls |
| $\begin{gathered} \text { SECTION A } \\ \text { (5Qx4M=20Marks) } \end{gathered}$ |  |  |  |
| S. No. |  | Marks | CO |
| Q 1 | The ratio of two successive amplitudes for free vibrations of a system is 1.2. Calculate the damping factor. | 4 | CO 2 |
| Q 2 | Explain ply steer and conicity. | 4 | $\mathrm{CO1}$ |
| Q 3 | Analyze the effect of locking up of front tires during braking. | 4 | CO2 |
| Q 4 | Explain the Ackerman condition for low speed turning. | 4 | CO1 |
| Q 5 | Draw a rough sketch of a 7 DOF system for analyzing vertical dynamics of a car and state the 7 motions that can be analyzed with this model. | 4 | $\mathrm{CO1}$ |
| $\begin{gathered} \text { SECTION B } \\ (4 \mathrm{Qx} 10 \mathrm{M}=40 \text { Marks }) \end{gathered}$ |  |  |  |
| Q 6 | A car with mass $=2000 \mathrm{~kg}$, wheel base $=2.8 \mathrm{~m}$ has $55 \%$ of weight distribution on front tires. Lateral stiffness of front and rear tires is $C_{f}=$ $40 \mathrm{kN} / \mathrm{rad}$ and $C_{r}=35 \mathrm{kN} / \mathrm{rad}$. Calculate the understeer coefficient and critical speed or characteristic speed as applicable. | 10 | $\mathrm{CO3}$ |
| Q 7 | Design a brake system having ideal brake force distribution under the following condition. $60 \%$ of the vehicle static load is on the rear axle. The ratio of height of CG to wheel base, $\mathrm{h} / \mathrm{L}=0.25$. Coefficient of friction $\mu=1.05$, coefficient of rolling resistance $f_{r}=0.03$. (Note: Design here means determination of $K_{b f}$ and $K_{b r}$ ) | 10 | $\mathrm{CO4}$ |
| Q 8 | Analyze the effect of stress frequency and temperature on behaviour (modulus and hysteresis) of rubber. | 10 | CO2 |
| Q 9 | A $150-\mathrm{kg}$ machine is mounted on an elastic foundation of stiffness $3 \times 10^{6} \mathrm{~N} / \mathrm{m}$. When operating at $100 \mathrm{rad} / \mathrm{s}$, the machine is subject to a harmonic force of magnitude 1500 N . The steady-state amplitude of the machine is measured as 2 mm . Calculate the damping ratio of the foundation? | 10 | $\mathrm{CO3}$ |

|  | OR <br> A machine runs at 4000 rpm . Its forcing frequency is very near to its natural frequency. If the nearest natural frequency of the 2 DOF system is to be at least $10 \%$ from the forced frequency, design a suitable vibration absorber. Mass of machine is 50 kg . |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \text { SECTION-C } \\ \text { (2Qx20M=40 Marks) } \\ \hline \end{gathered}$ |  |  |  |
| Q 10 | A driver, by mistake, got on to a high slope road in Himalayas, having a downward slope of $40^{\circ}$. The brake system of the car is adaptive and able to give ideal performance (maximum braking force on the front as well as rear wheels simultaneously). The driver achieves a maximum deceleration of $0.5 \mathrm{~m} / \mathrm{s}^{2}$. Neglect the aerodynamic drag. <br> Determine <br> (a) The load on front and rear axle <br> (b) The coefficient of friction between tire and road. <br> (c) The available braking force <br> The relevant data is the following - <br> Mass of car, $\mathrm{m}=1400 \mathrm{~kg}$ <br> Wheel base, $\mathrm{L}=2.8 \mathrm{~m}$ <br> Distance of CG from front axle, $l_{1}=1.45 \mathrm{~m}$ <br> Height of CG, $\mathrm{h}=0.25 \mathrm{~m}$ <br> Coefficient of rolling resistance, $f_{r}=0.02$ <br> Use $\mathrm{g}=10 \mathrm{~m} / \mathrm{s}^{2}$ | 20 | CO4 |
| Q 11 | Calculate the pitch and bounce frequencies, mode shapes and the locations of oscillation centers of an automobile with the following data. Note: Must derive the equation of motion first by drawing appropriate free body diagram. <br> Sprung mass, $m_{s}=2100 \mathrm{~kg}$ <br> Radius of gyration, $r_{y}=1.45 \mathrm{~m}$ <br> Distance from front axle to $\mathrm{CG}=1.35 \mathrm{~m}$ <br> Distance from rear axle to CG $=1.45 \mathrm{~m}$ <br> Front spring stiffness, $k_{f}=42 \mathrm{kN} / \mathrm{m}$ <br> Rear spring stiffness, $k_{r}=38 \mathrm{kN} / \mathrm{m}$ <br> OR <br> Vertical dynamics in a vehicle is modeled using the quarter car model. | 20 | CO 3 |

| The Sprung mass, $m_{s}=2400 \mathrm{~kg}$, Unsprung mass, $m_{u s}=300 \mathrm{~kg}$, |  |  |
| :--- | :--- | :--- | :--- |
| Suspension system stiffness, $k_{s}=100 \mathrm{kN} / \mathrm{m}$, Tire stiffness, $k_{t}=$ |  |  |
| $800 \mathrm{kN} / \mathrm{m}$. Damping coefficients are $c_{s}, c_{t}$. |  |  |
|  | (a) Calculate the natural frequencies using approximate method. <br> (b) Derive the equations of motion <br> (c) Using equations from part (b), determine the natural frequencies and <br> mode shapes. Also compare the results of (a) and (c). |  |
